Solution details for healthcare professionals

- The Mobile-To-Mobile convergence (MMC) solution grants end users continuous accessibility by relying on a single device for placing and receiving all calls (MMC is the seamless convergence of Wi-Fi and cellular networks).
- The Solution enables seamless roaming (back and forth) between Wi-Fi and cellular networks, resulting increased response time, and thus productivity, among mobile workers.

Solution Architecture

Unified Mobile-to-Mobile Convergence

The Solution has a three-pronged approach to easing mobile-communication pain-points

CONTINUITY

It provides critical continuity of communications across any carrier and any Wi-Fi network. Active-call handoff occurs without dropping the call.

CONTROL

The MMC solution is designed for the enterprise, placing total control of the devices, functionality, and usage policies in the hands of the enterprise IT administrators.

COST

The MMC solution reduces the dependence on expensive cellular plans by automatically and seamlessly choosing the most cost-optimized method for connectivity – cellular or Wi-Fi.
